Structures practice: answer key

Use after the first response. Equivalent accurate wording is accepted.

Label	Structure	Job
A	mouth	Food enters; saliva mixes with it.
B	teeth	Cut and grind food into pieces.
C	salivary glands	Make saliva containing amylase.
D	oesophagus	Moves food by peristalsis.
E	liver	Makes bile.
F	stomach	Churns; acid and protease act here.
G	gall bladder	Stores and releases bile.
H	pancreas	Makes digestive enzymes.
I	large intestine	Absorbs water from gut contents.
J	small intestine	Finishes digestion; absorbs nutrients.
K	rectum	Stores faeces before release.
L	anus	Controls the release of faeces.

1. Food route

mouth → oesophagus → stomach → small intestine → large intestine → rectum → anus.

A → D → F → J → I → K → L. Teeth are within the mouth, not an extra canal stop.

2. Structure and function

C: makes saliva containing amylase. H: supplies digestive enzymes into the small intestine. G: stores/releases bile; the liver makes it.

3. Villus explanation

A thin lining gives a short distance for molecules to cross, supporting rapid absorption. The crossing is absorption, not chemical digestion.

Criteria

Label endpoints land on the named structures. Route contains the seven canal stops in order and no accessory organs. Organ functions are accurately matched. The villus answer connects feature to effect, rather than naming a feature alone.

This practice samples functions; it does not prove unaided mastery of all 12 jobs. Close reference pages for protected fresh evidence; retain usual access.
