Comparing plant, animal and bacterial cells

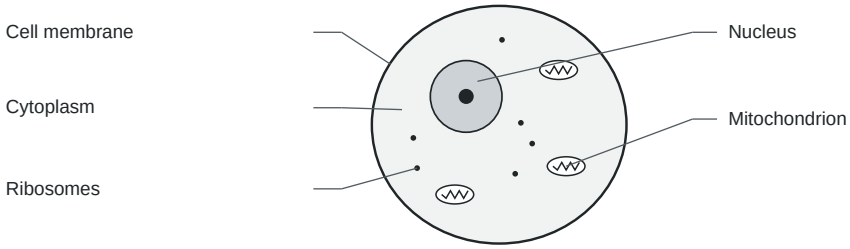

Year 8 | Labelled reference sheet | Generalised cell models

01 Plant cell - a photosynthetic example

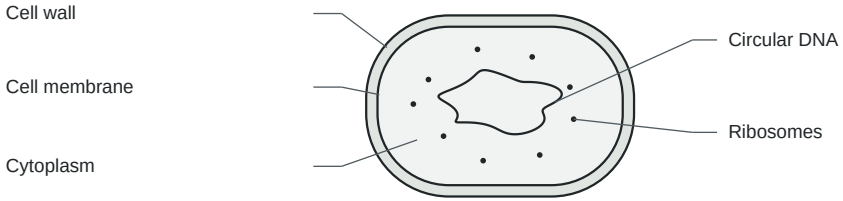

Chloroplasts occur in photosynthetic cells. Many plant cells, such as root cells, lack them.

02 Animal cell

Animal cells have a cell membrane but no cell wall or chloroplasts.

03 Bacterial cell

Bacteria have genetic material free in the cytoplasm; they have no nucleus.
The typical bacterial cell wall shown here is not cellulose. No mitochondria or chloroplasts.
Some bacteria also have plasmids, a capsule or a flagellum; these are not shown.

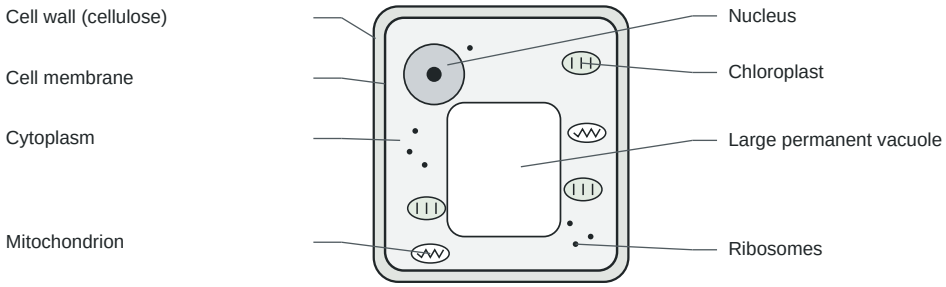

All three have a cell membrane, cytoplasm, ribosomes and genetic material.
Plant and animal cells normally hold their genetic material inside a nucleus.
Compare structures, not the outline of the drawing or its colour.

Original Edu OS schematics. Not to scale; bacteria are usually much smaller than plant and animal cells.
